NEW QUESTION: 76

An administrator is evaluating whether to deploy vCenter Server on a Windows server or on a vCenter Server appliance. The administrator has the following requirements:

- A web browser will be utilized to manage the vSphere environment.
- 16 ESXi hosts will be deployed.
- Licenses must be shared with a vCenter Server at another site.
- An external Oracle 10g database server will be used to host the vCenter Server database.

Why will the administrator need to deploy vCenter Server on a Windows server?

- A. Linked Mode is a requirement for the solution.
- B. Oracle 10g is a requirement for the solution.
- C. The vSphere web client is a requirement for the solution.
- D. Management of more than 5 hosts is a requirement for the solution.

Answer: (SHOW ANSWER)

Explanation/Reference:

Explanation:

Since licenses will be shared with a vCenter Server at another site, linked mode would be required. Link mode joins multiple vCenter Server sites and allows them to share information.

NEW QUESTION: 172

Which two choices are VMware-recommended ESXi syslog configurations? (Choose two.)

- A. Remote logging to a central host.
- B. Store logs in the in-memory filesystem.
- C. Configure persistent logging to a datastore.
- D. Configure logging to the vCenter Server.

Answer: (SHOW ANSWER)

Explanation/Reference:

Explanation:

Take the following measures to increase the security of the host.

- Configure persistent logging to a datastore. By default, the logs on ESXi hosts are stored in the in-memory file system. Therefore, they are lost when you reboot the host, and only 24 hours of log data is stored. When you enable persistent logging, you have a dedicated record of server activity available for the host.
- Remote logging to a central host allows you to gather log files onto a central host, where you can monitor all hosts with a single tool. You can also do aggregate analysis and searching of log data, which might reveal information about things like coordinated attacks on multiple hosts.
- Configure remote secure syslog on ESXi hosts using a remote command line such as vCLI or PowerCLI, or using an API client.
- Query the syslog configuration to make sure that a valid syslog server has been configured, including the correct port.

NEW QUESTION: 182

You are editing the management network configuration of an ESXi 6.x Host from the vSphere Web Client.

You mistakenly put the incorrect VLAN in place for the management network.

What action do you need to take to correct this?

- A. You need to manually edit the configuration on the host with command line utilities.

- B.** No action is required. By default, ESXi rolls back configuration changes that disconnect the host.
- C.** The ESXi host system configuration will need to be restored to the factory configuration to fix the issue.
- D.** The change can be reverted in the vSphere Web Client by simply editing the switch again.

Answer: ([SHOW ANSWER](#))

Explanation/Reference:

Explanation:

By rolling configuration changes back, vSphere protects hosts from losing connection to vCenter Server as a result from misconfiguration of the management network. In this case, configuring the wrong VLAN on the management network would result in a lost connection to the server.
